

REFLEX READINESS SPRINT

Final Strategic Trade-off Log & Roadmap

1. Strategic Trade-off Log (Final)

This log documents our intentional design choices and our proactive 'StatusEvent' improvement to ensure a reliable logistics prototype.

Design Choice	Strategic Justification	Future Evolution
Audit Trail (Self-Corrected)	We proactively identified the need for a 'StatusEvent' history to resolve disputes and implemented it mid-sprint to ensure data integrity.	Build a 'Delivery Timeline' view for retailers to see exactly when every step occurred.
Open API Access		Integrate WhatsApp OTP for secure, password-less login.
Manual Sync Model	Battery-First approach. Background polling drains data bundles. Users 'pull' data only when they have signal.	Implement Push Notifications for urgent priority assignments.
Lightweight Frontend		Add client-side form validation to improve data entry accuracy.
Local SQLite Storage	Allowed for a fast backend lock, giving the team more time for edge-case testing and narrative preparation.	Migrate to cloud-hosted PostgreSQL for scaling to multiple regions.

2. Updated Strategic Roadmap (v2.0)

- Phase 1 (Short Term): Implement Role-Based UI to hide Dispatcher tools from Riders.
- Phase 2 (Medium Term): Implement QR scanning to replace manual button-based confirmation.
- Phase 3 (Long Term): Build an 'Offline-First' engine to allow updates in remote areas with zero signal.
